Background: The protein encoded by this gene is a member of the transmembrane 4
superfamily, also known as the tetraspanin family. Most of these members are cell-surface
proteins that are characterized by the presence of four hydrophobic domains. The proteins
mediate signal transduction events that play a role in the regulation of cell development,
activation, growth and motility. This encoded protein is a cell surface antigen and is highly
expressed in different carcinomas. [provided by RefSeq, Jul 2008]
