| | Background: Acetyl-CoA carboxylase (ACC) is a complex multifunctional enzyme system. ACC | |
| | is a biotin-containing enzyme which catalyzes the carboxylation of acetyl-CoA to malonyl-CoA, | |
| | the rate-limiting step in fatty acid synthesis. There are two ACC forms, alpha and beta, encoded | |
| | by two different genes. ACC-alpha is highly enriched in lipogenic tissues. The enzyme is under | |
| | long term control at the transcriptional and translational levels and under short term regulation | |
| | by the phosphorylation/dephosphorylation of targeted serine residues and by allosteric | |
| | transformation by citrate or palmitoyl-CoA. Multiple alternatively spliced transcript variants | |
| | divergent in the 5' sequence and encoding distinct isoforms have been found for this gene. | |
