Background:	Synonyms: AQP9, AQP7L, AQPap, GLYCQTL, Aquaporin-7, AQP-7, Aquaglyceroporin-7,
	Aquaporin adipose, Aquaporin-7-like, AQP7
	Background: Water is a critical component of all living cells. Interestingly, tissue membranes
	show a great degree of water permeability. Mammalian red cells, renal proximal tubules, and
	descending thin limb of Henle are extraordinarily permeable to water. Water crosses
	hydrophobic plasma membranes either by simple diffusion or through a facilitative transport
	mechanism mediated by special protein "aquaporin". Over the last decade, genes for several
	members of aquaporin family have been cloned, expressed, and their distribution studied in
	many tissues. AQP0 or MIP26 (major intrinsic protein 26kD), and Aquaporin 1 (AQP1, purified
	from red cells) also called CHIP28 (channel forming integral protein, 28kD, 268aa, gene locus
	7p14) has been the foundation of the growing family of aquaporin. The lens specific AQP0
	represents up to 80 $\%$ of total lens membrane protein. Defects in MIP26 are cause of
	autosomal dominant cataract. The cataract Fraser mutation (CATFR or Shriveled) is a
	transposon induced splicing error that substitutes a long terminal repeat sequence for the C
	terminus of MIP. The lens opacity mutation (LOP) is an amino acid substitution that inhibits
	targeting of MIP to the cell membrane.
