	caspase activation inhibitor, Cell death regulator Aven, OTTMUSP00000016129, PDCD12,
	Programmed cell death 12, RP23-52C15.2, AVEN_HUMAN
	Background: Apoptosis plays a major role in normal organism development, tissue
	homeostasis, and removal of damaged cells. Disruption of this process has been implicated in
	a variety of diseases such as cancer. AVEN is a recently discovered protein that blocks
	apoptosis induced by Apaf-1 and caspase-9. It is thought that AVEN functions by binding to Bcl-
	xL, an antiapoptotic member of the Bcl-2 family, and to Apaf-1, possibly interfering with the
	ability of Apaf-1 to self-associate, suggesting that AVEN impedes Apaf-1-mediated caspase
	activation. Higher levels of AVEN mRNA are seen in patients with acute leukemia than in control
	patients, suggesting that AVEN may be useful as a prognostic indicator in leukemia patients.
