	complex, which is involved in transcriptional activation of select genes principally by acetylation
	of nucleosomal histone H4 and H2A. The gene encoding MEAF6 localizes to chromosome 1
	and, due to alternative splicing events, MEAF6 exists in at least three isoforms. Chromosome 1
	is the largest human chromosome spanning about 260 million base pairs and making up 8 $\%$ of
	the human genome. There are about 3,000 genes on chromosome 1, and considering the great
	number of genes there are also a large number of diseases associated with chromosome 1
	such as Hutchinson-Gilford progeria, Stickler syndrome, Parkinsons, Gaucher disease and
	Usher syndrome.
