uncharacterized protein C22orf43, Uncharacterized protein C22orf43.		
Background: C22orf43 (chromosome 22 open reading frame 43), also known as MGC33025 or		
MGC75009, is a 229 amino acid protein encoded by a gene located on human chromosome 22		
which contains over 500 genes and about 49 million bases. As the second smallest human		
chromosome, chomosome 22 contains a wide variety of genes with numerous functions.		
Phelan-McDermid syndrome, Neurofibromatosis type 2 and autism are associated with		
chromosome 22. A schizophrenia susceptibility locus has been identified on chromosome 22		
and studies show that 22q11 deletion symptoms include a high incidence of schizophrenia.		
Translocations between chromosomes 9 and 22 may lead to the formation of the Philadelphia		
Chromosome and the subsequent production of the novel fusion protein, BCR-Abl, a potent cell		
proliferation activator found in several types of leukemia.		

Gene ID:

51233
