	kinase-like 5, EIEE2, ISSX, Serine/threonine kinase 9, Serine/threonine-protein kinase 9, Stk9.
	Background: Cell cycle progression is controlled in part by a family of cyclin proteins and cyclin-
	dependent kinases (Cdks). Cdk proteins work in concert with the cyclins to phosphorylate key
	substrates involved in each phase of cell cycle progression. Another family of proteins, Cdk
	inhibitors, also plays a role in regulating the cell cycle by binding to cyclin-Cdk complexes and
	modulating their activity. CDKL5 (cyclin-dependent kinase-like 5) is a 1030 amino acid protein
	that belongs to the CMGC Ser/Thr protein kinase family. Expressed in brain, lung, kidney,
	prostate, ovary, placenta, pancreas and testis, CDKL5 is thought to play a role in cell cycle
	regulation. Defects in CDKL5 are a cause of several disorders, such as X-linked infantile spasm
	syndrome and Rett syndrome.
