Malonyl-CoA, an intermediate in fatty acid synthesis, has been implicated as a regulatory component of the		
	energy sensing system that feeds into hypothalmic neurons to impart energy homeostasis.		
	Malonyl-CoA levels in the hypothalamus are dynamically regulated by fasting and feeding,		
	altering subsequent feeding behaviour. Cpt1c, the brain-specific carnitine O-		
	palmitoyltransferase 1, is thought to relay information about malonyl-CoA levels in		
	hypothalamic neurons that express orexigenic and anorexigenic neuropeptides that regulate		
	food intake and peripheral energy expenditure. Unlike other Cpt1 proteins, Cpt1c binds Malonyl-		
	CoA but does not catalyse the transfer of the malonyl group from CoA to carnitine.
