Homolog Subunit 7b; COP9 Signalasome Subunit 7b; COP9 signalosome complex subunit 7b;
COPS7B; CSN7B_HUMAN; JAB1 Containing Signalosome Subunit 7b; JAB1-containing
signalosome subunit 7b; SGN7b; Signalosome subunit 7b.
Background: The COP9 signalosome (CSN) complex is involved in several different
developmental and cellular processes. The complex is made up of several widely expressed
proteins: CSN1 (COPS1), CSN2 (COPS2), CSN3 (COPS3), CSN4 (COPS4), CSN5 (COPS5), CSN6
(COP6), CSN7a (COPS7, COPS7a) or CSN7b (COP7b) and CSN8 (COP8). The CSN complex acts
as a regulator for the ubiquitin conjugation pathway by mediating the deneddylation of the SCF-
type E3 ligase complexes, which leads to a decrease in ubiquitin ligase activity of SCF-
complexes. It is also involved in the phosphorylation of p53, c-Jun, I°Bå and IRF-8, as well as
CSN-dependent phosphorylation of p53, and c-Jun protects and promotes degradation by the
Ubl system. CSN7 is phosphorylated by CK2 and is composed of two subunits; a and b. CSN7a
contains a PCI (Proteasome CSN9 initiation factor 3) region, as well as a coiled-coil region and
is predicted to interact with CSN2, CSN3, CSN4, CSN5, CSN6, CSN8, and GPS1. CSN7b contains
only a PCI region and is predicted to interact with INT6.
