	FLJ20018, Metal transporter CNNM3, CNNM3_HUMAN.
	Background: Cyclin M3 is a 707 amino acid multi-pass membrane protein that shares weak
	sequence similarity with cyclin proteins, yet displays no cyclin-like function in vivo. Though
	ubiquitously expressed, Cyclin M3 is found at highest levels in kidney, brain, spleen and heart.
	Cyclin M3 is localized to the nucleus where it is likely a metal transporter. Cyclin M3 contains
	two CBS domains, which appear to bind ligands with an adenosyl group such as AMP, ATP and
	S-AdoMet and may play a regulatory role in sensitizing proteins to adenosyl-carrying ligands.
	There are three isoforms of Cyclin M3 that are produced as a result of alternative splicing
	events.
