	Fucosyltransferase VI, FucT VI, Galactoside 3 L fucosyltransferase, FUT6_HUMAN.
	Background: Glycosyltransferases that mediate the regio- and stereoselective transfer of
	sugars, such as the fucosyltransferases, determine cell surface-carbohydrate profiles, which is
	an essential interface for biological recognition processes. Fucosyltransferases catalyze the
	covalent association of fucose to different positional linkages in sugar acceptor molecules. The
	carbohydrate moieties generated and covalently attached to cell surfaces are necessary to
	ensure a surface contour that satisfies physiological roles, which are reliant on adhesion
	molecules such as Selectins (1-3). Hematopoietic lineages rely on Fucosyltransferases to
	confer a surface carbohydrate phenotype, which mediates proper cell adhesion molecule
	recruitment and cell trafficking (4-6).
