Background:	Synonyms: G protein beta subunit like, G protein beta subunit-like, Gable, GBL, GBL protein,
backgi ounu.	LST8_HUMAN, Mammalian lethal with SEC13 protein 8, MGC111011, mLST8, Protein GbetaL,
	Target of rapamycin complex subunit LST8, TORC subunit LST8.
	Background: Subunit of both mTORC1 and mTORC2, which regulates cell growth and survival ir
	response to nutrient and hormonal signals. mTORC1 is activated in response to growth factors
	or amino-acids. Growth factor-stimulated mTORC1 activation involves a AKT1-mediated
	phosphorylation of TSC1-TSC2, which leads to the activation of the RHEB GTPase that potently
	activates the protein kinase activity of mTORC1. Amino-acid-signaling to mTORC1 requires its
	relocalization to the lysosomes mediated by the Ragulator complex and the Rag GTPases.
	Activated mTORC1 up-regulates protein synthesis by phosphorylating key regulators of mRNA
	translation and ribosome synthesis. mTORC1 phosphorylates EIF4EBP1 and releases it from
	inhibiting the elongation initiation factor 4E (eiF4E). mTORC1 phosphorylates and activates
	S6K1 at 'Thr-389', which then promotes protein synthesis by phosphorylating PDCD4 and
	targeting it for degradation. Tissue specificity: Broadly expressed, with highest levels in skeletal
	muscle, heart and kidney.
Pathways:	PI3K-Akt Signaling, RTK Signaling, Fc-epsilon Receptor Signaling Pathway, EGFR Signaling
	Pathway, Neurotrophin Signaling Pathway, Regulation of Actin Filament Polymerization,
	Autophagy, CXCR4-mediated Signaling Events, BCR Signaling, Warburg Effect
