Alternative Name:	GCP3/Gamma-tubulin complex component 3 (TUBGCP3 Products)	
Background:	Synonyms: Gamma-ring complex protein 104 kDa, Gamma-tubulin complex component 3, GCP	
	3, GCP3, GCP3_HUMAN, h104p, hGCP3, hGrip104, hSpc98, SPBC98, Spc98p, Spindle pole body	
	protein Spc98 homolog, TUBGCP3, Tubulin gamma complex associated protein 3.	
	Background: The Gamma-Tubulin complex is composed of Gamma Tubulin and the Gamma-	
	Tubulin complex-associated proteins GCP2, GCP3, GCP4, GCP5 and GCP6, all of which are	
	essential components of microtubule organizing centers. Gamma-Tubulin complex	
	components are localized to both the centrosome, where they are involved in microtubule	
	nucleation, and to the cytoplasm, where they exist as soluble complexes that can be recruited	
	to the centrosome as needed. Although the GCP proteins are related, they have distinct roles	
	which contribute to the proper function of the Gamma-Tubulin complex. GCP3 (Gamma-	
	Tubulin complex component 3), also known as TUBGCP3 or SPBC98, localizes to the	
	centrosome and is a ubiquitously expressed 907 amino acid member of the Gamma-Tubulin	
	complex. Like GCP2 and Gamma Tubulin, GCP3 is conserved in all eukaryotes, suggesting that	
	it is part of a core unit involved in eukaryotic microtubule nucleation. Three isoforms of GCP3	
	exist due to alternative splicing events.
