	Background: HIBCH is a 386 amino acid protein belonging to the enoyl-CoA
	hydratase/isomerase family. Localizing to the mitochondria, HIBCH is highly expressed in liver
	and kidney, with lower levels found in heart, muscle and brain. HIBCH hydrolyzes HIBYL-CoA, a
	saline catabolite, andhydroxypropionyl-CoA, an intermediate in the minor pathway involved in
	the metabolism of proprionate. Existing as two alternatively spliced isoforms, the gene
	encoding HIBCH maps to human chromosome 2q32.2. Defects to this gene result in HIBCH
	deficiency (HIBCHD), known alternatively as deficiency ofhydroxyisobutyryl CoA deacylase or
	methacrylic aciduria. HIBCHD is characterized by the accumulation of methacrylyl-CoA, a highly
	reactive compound that undergoes addition reactions with free sulfhydryl groups. Phenotypic
	symptoms include early deterioration of neurological function, delayed motor skill development
	and hypotonia.
