	INHBA
	Background: Inhibins and activins inhibit and activate, respectively, the secretion of follitropin by
	the pituitary gland. Inhibins/activins are involved in regulating a number of diverse functions
	such as hypothalamic and pituitary hormone secretion, gonadal hormone secretion, germ cell
	development and maturation, erythroid differentiation, insulin secretion, nerve cell survival,
	embryonic axial development or bone growth, depending on their subunit composition. Inhibins
	appear to oppose the functions of activins.
Gene ID:	3624
UniProt:	P08476
Pathways:	Hormone Transport, Peptide Hormone Metabolism
