Target Details	
Background:	Ubiquitin (see MIM 191339)-dependent proteolysis is a complex pathway of protein
	metabolism implicated in such diverse cellular functions as maintenance of chromatin
	structure, receptor function, and degradation of abnormal proteins. A late step of the process
	involves disassembly of the polyubiquitin chains on degraded proteins into ubiquitin
	monomers. USP5 disassembles branched polyubiquitin chains by a sequential exo mechanism,
	starting at the proximal end of the chain (Wilkinson et al., 1995 [PubMed 7578059]).[supplied by
