Target Details

| | emerging neuron-like stem cells. The metabolism of Ach is relatively simple, involving only two |
|----------|---|
| | enzymes: choline acetyltransferase (ChAT) for synthesis and acetylcholinesterase (AChE) for |
| | degradation. Further, acetylcholine has little function in neurons other than neurotransmission |
| | and seems to be neuron specific. It seems that only cholinergic neurons have significant |
| | amounts of ChAT making anti-choline acetyltransferase a useful specific marker. ChAT is a |
| | valuable marker for diseases associated with decreased cholinergic function such as |
| | Schizophrenia, Alzheimer disease and Down syndrome (1-3). |
| Gene ID: | 1103 |

| NCBI Accession: | NP_001136401 |
|-----------------|-----------------------------------|
| UniProt: | P28329 |
| Pathways: | Skeletal Muscle Fiber Development |

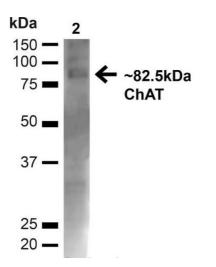

Application Details

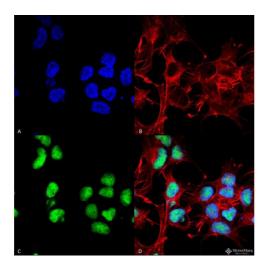

| Application Notes: | WB (1:1000) ICC/IF (1:100) optimal dilutions for assays should be determined by the user. |
|--------------------|---|
| Comment: | A 1:1000 dilution of ABIN2869105 was sufficient for detection of Choline Acetyltransferase on mouse brain lysates using Goat anti-rabbit IgG:HRP as the secondary antibody. |
| Restrictions: | For Research Use only |
