Datasheet for ABIN2870752 LDLR Protein (AA 22-790) (His tag)

2 Images

Overview

Quantity:	100 µg
Target:	LDLR
Protein Characteristics:	AA 22-790
Origin:	Mouse
Source:	HEK-293 Cells
Protein Type:	Recombinant
Biological Activity:	Active
Purification tag / Conjugate:	This LDLR protein is labelled with His tag.

Product Details

Sequence:	AA 22-790
Characteristics:	This protein carries a polyhistidine tag at the C-terminus. The protein has a calculated MW of
	86.2 kDa. The protein migrates as 120 kDa under reducing (R) condition (SDS-PAGE) due to
	glycosylation.
Purity:	>95 % as determined by reduced SDS-PAGE.
Endotoxin Level:	Less than 1.0 EU per μ g by the LAL method.
Target Details	
Target:	LDLR
Alternative Name:	LDL R (LDLR Products)

Target Details	
Background:	Low-Density Lipoprotein (LDL) Receptor is also known as LDLR, FH, FHC, LDLCQ2, and is a
	mosaic protein of ~840 amino acids (after removal of signal peptide) that mediates the
	endocytosis of cholesterol-rich LDL. It is a cell-surface receptor that recognizes the apoprotein
	B100 which is embedded in the phospholipid outer layer of LDL particles. The receptor also
	recognizes the apoE protein found in chylomicron remnants and VLDL remnants (IDL). It
	belongs to the Low density lipoprotein receptor gene family. LDL receptor complexes are
	present in clathrin-coated pits (or buds) on the cell surface, which when bound to LDL-
	cholesterol via adaptin, are pinched off to form clathrin-coated vesicles inside the cell. This
	allows LDL-cholesterol to be bound and internalized in a process known as endocytosis and
	prevents the LDL just diffusing around the membrane surface. This occurs in all nucleated cells
	(not erythrocytes), but mainly in the liver which removes \sim 70 % of LDL from the circulation.
	Synthesis of receptors in the cell is regulated by the level of free intracellular cholesterol, if it is
	in excess for the needs of the cell then the transcription of the receptor gene will be inhibited.
	LDL receptors are translated by ribosomes on the endoplasmic reticulum and are modified by
	the Golgi apparatus before travelling in vesicles to the cell surface. LDL is directly involved in the
	development of atherosclerosis, due to accumulation of LDL-cholesterol in the blood.
	Atherosclerosis is the process responsible for the majority of cardiovascular diseases.
Molecular Weight:	86.2 kDa
NCBI Accession:	NP_034830
Pathways:	Hepatitis C, Lipid Metabolism

Application Details

Restrictions:

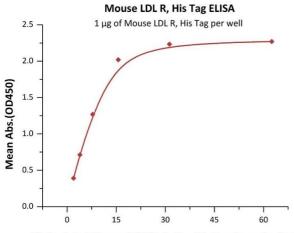

For Research Use only

Handling

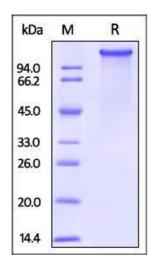

Format:	Lyophilized
Buffer:	PBS, pH 7.4
Handling Advice:	Please avoid repeated freeze-thaw cycles.
Storage:	-20 °C
