# **Target Details**

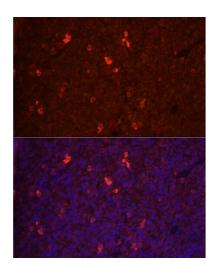

| Target:             | RANKL (TNFSF11)  |  |  |
|---------------------|--|--|--|
| Alternative Name:   | TNFSF11 (TNFSF11 Products)   |  |  |
| Background:         | This gene encodes a member of the tumor necrosis factor (TNF) cytokine family which is a           |  |  |
|                     | ligand for osteoprotegerin and functions as a key factor for osteoclast differentiation and        |  |  |
|                     | activation. This protein was shown to be a dentritic cell survival factor and is involved in the   |  |  |
|                     | regulation of T cell-dependent immune response. T cell activation was reported to induce           |  |  |
|                     | expression of this gene and lead to an increase of osteoclastogenesis and bone loss. This          |  |  |
|                     | protein was shown to activate antiapoptotic kinase AKT/PKB through a signaling complex             |  |  |
|                     | involving SRC kinase and tumor necrosis factor receptor-associated factor (TRAF) 6, which          |  |  |
|                     | indicated this protein may have a role in the regulation of cell apoptosis. Targeted disruption of |  |  |
|                     | the related gene in mice led to severe osteopetrosis and a lack of osteoclasts. The deficient      |  |  |
|                     | mice exhibited defects in early differentiation of T and B lymphocytes, and failed to form lobulo- |  |  |
|                     | alveolar mammary structures during pregnancy. Two alternatively spliced transcript variants        |  |  |
|                     | have been  |  |  |
