Target:	Glucocorticoid Receptor (NR3C1)
Alternative Name:	NR3C1 (NR3C1 Products)
Background:	The glucocorticoid receptor (GR, or GCR), also known as NR3C1, is the receptor to which
	cortisol and other glucocorticoids bind. In humans, the GR protein is encoded by NR3C1 gene
	which is located on chromosome 5 (5q31). GR is expressed in almost every cell in the body and
	regulates genes controlling the development, metabolism, and immune response. Because the
	receptor gene is expressed in several forms, it has many different (pleiotropic) effects in
	different parts of the body. The activated GR complex up-regulates the expression of anti-
	inflammatory proteins in the nucleus or represses the expression of pro-inflammatory proteins
	in the cytosol (by preventing the translocation of other transcription factors from the cytosol
	into the nucleus).
