Target Details

Background:	The bone morphogenetic protein (BMP) receptors are a family of transmembrane		
	serine/threonine kinases that include the type I receptors BMPR1A and BMPR1B and the type I receptor BMPR2. These receptors are also closely related to the activin receptors, ACVR1 and		
	ACVR2. The ligands of these receptors are members of the TGF-beta superfamily. TGF-betas		
	and activins transduce their signals through the formation of heteromeric complexes with 2		
	different types of serine (threonine) kinase receptors: type I receptors of about 50-55 kD and		
	type II receptors of about 70-80 kD. Type II receptors bind ligands in the absence of type I		
	receptors, but they require their respective type I receptors for signaling, whereas type I		
	receptors require their respective type II receptors for ligand binding. Synonyms: ACVRLK3, ALK		
	3, ALK3, Activin receptor-like kinase 3, Bone morphogenetic protein receptor type-1A, SKR5,		
	Serine/threonine-protein kinase receptor R5
