Target Details	
Background:	Protein kinases are enzymes that transfer a phosphate group from a phosphate donor,
	generally the g phosphate of ATP, onto an acceptor amino acid in a substrate protein. By this
	basic mechanism, protein kinases mediate most of the signal transduction in eukaryotic cells,
	regulating cellular metabolism, transcription, cell cycle progression, cytoskeletal rearrangement
	and cell movement, apoptosis, and differentiation. With more than 500 gene products, the
	protein kinase family is one of the largest families of proteins in eukaryotes. The family has
	been classified in 8 major groups based on sequence comparison of their tyrosine (PTK) or
	serine/threonine (STK) kinase catalytic domains. The STE group (homologs of yeast Sterile 7,
	11, 20 kinases) consists of 50 kinases related to the mitogen-activated protein kinase (MAPK)
	cascade families (Ste7/MAP2K, Ste11/MAP3K, and Ste20/MAP4K). MAP kinase cascades,
	consisting of a MAPK and one or more upstream regulatory kinases (MAPKKs) have been best
	characterized in the yeast pheromone response pathway. Pheromones bind to Ste cell surface
	receptors and activate yeast MAPK pathway.Synonyms: NDK 7, NDP kinase 7, Nucleoside
	diphosphate kinase 7
