

Datasheet for ABIN367381

## Anti-Myeloperoxidase Antibody (MPO pANCA) ELISA Kit

[Go to Product page](#)

1 Image

1 Publication

### Overview

Quantity: 96 tests

Target: Anti-Myeloperoxidase Antibody (MPO pANCA)

Reactivity: Mouse

Method Type: Competition ELISA

Detection Range: 0.625-40 ng/mL

Minimum Detection Limit: 0.625 ng/mL

Application: ELISA

### Product Details

Purpose: This immunoassay kit allows for the in vitro quantitative determination of mouse myeloperoxidase-antineutrophil cytoplasmic antibody concentrations in serum, plasma.

Sample Type: Serum, Plasma

Analytical Method: Quantitative

Detection Method: Colorimetric

Specificity: This assay recognizes mouse myeloperoxidase-antineutrophil cytoplasmic antibody.

Cross-Reactivity (Details): Limited by current skills and knowledge, it is impossible for us to complete the cross-reactivity detection between the target antigen and all analogues for other species. Therefore, cross reaction may still exist.

Sensitivity: 0.156 ng/mL

Components: • Assay plate (12 × 8 coated Microwells)

## Product Details

---

- Standard (freeze dried)
- Biotin-antibody (100 × concentrate)
- HRP-avidin (100 × concentrate)
- Biotin-antibody Diluent
- HRP-avidin Diluent
- Sample Diluent
- Wash Buffer (25 × concentrate)
- TMB Substrate
- Stop Solution
- Adhesive Strip (for 96 wells)
- Instruction manual

Material not included:	<ul style="list-style-type: none"><li>• Microplate reader capable of measuring absorbance at 450nm, with the correction wavelength set at 540nm or 570nm.</li><li>• An incubator which can provide stable incubation conditions up to 37°C ± 0.5°C.</li><li>• Squirt bottle, manifold dispenser or automated microplate washer.</li><li>• Absorbent paper for blotting the microtiter plate.</li><li>• 100mL and 500mL graduated cylinders.</li><li>• Deionized or distilled water.</li><li>• Pipettes and pipette tips.</li><li>• Test tubes for dilution.</li></ul>
------------------------	---

## Target Details

---

Target:	Anti-Myeloperoxidase Antibody (MPO pANCA)
Alternative Name:	myeloperoxidase-antineutrophil cytoplasmic antibody ( <a href="#">MPO pANCA Products</a> )
Target Type:	Antibody

## Application Details

---

Application Notes:	<ul style="list-style-type: none"><li>• The supplier is only responsible for the kit itself, but not for the samples consumed during the assay. The user should calculate the possible amount of the samples used in the whole test. Please reserve sufficient samples in advance.</li><li>• Samples to be used within 5 days may be stored at 2-8°C, otherwise samples must be stored at -20°C (≤ 1 month) or -80°C (≤ 2 months) to avoid loss of bioactivity and contamination.</li><li>• Grossly hemolyzed samples are not suitable for use in this assay.</li><li>• If the samples are not indicated in the manual, a preliminary experiment to determine the validity of the kit is necessary.</li><li>• Please predict the concentration before assaying. If values for these are not within the range of the standard curve, users must determine the optimal sample dilutions for their particular experiments.</li></ul>
--------------------	---

- Tissue or cell extraction samples prepared by chemical lysis buffer may cause unexpected ELISA results due to the impacts of certain chemicals.
- Owing to the possibility of mismatching between antigens from another resource and antibodies used in this supplier's kits (e.g., antibody targets conformational epitope rather than linear epitope), some native or recombinant proteins from other manufacturers may not be recognized by this supplier's products.
- Influenced by factors including cell viability, cell number and cell sampling time, samples from cell culture supernatant may not be recognized by the kit.
- Fresh samples without long time storage are recommended for the test. Otherwise, protein degradation and denaturalization may occur in those samples and finally lead to wrong results.

---

Comment:

Detection wavelength: 450 nm

Information on standard material:

Depending on the antigen to be detected, standards can be either native or recombinant protein. The recombinant proteins are being expressed in CHO cells in most cases. Please inquire for more information. The formulation of auxiliary material in the standard is considered proprietary information, however it does not contain any poisonous substance. Proclin 300 (1:3000) is used as preservative.

Information on reagents:

In most cases the stop solution provided is 1 N H<sub>2</sub>SO<sub>4</sub>. The formulation of wash solution is proprietary information. None of the components contain (sodium) azide, thimerosal, 2-mercaptoethanol (2-ME) or any other poisonous materials. For the sandwich method kits, the sample diluent, antibody diluent, enzyme diluent and standard all contain BSA.

Information on antibodies:

The antibodies provided in different kits vary in regards to clonality and host. Some antibodies are affinity purified, some are Protein A

---

Assay Time:

1 - 4.5 h

---

Plate:

Pre-coated

---

Protocol:

The microtiter plate provided in this kit has been pre-coated with myeloperoxidase-antineutrophil cytoplasmic antigen. Standards or samples are then added to the appropriate microtiter plate wells with biotin-conjugated myeloperoxidase-antineutrophil cytoplasmic and Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. Then a TMB (3,3',5,5' tetramethyl-benzidine) substrate solution is added to each well.

Only those wells that contain myeloperoxidase-antineutrophil cytoplasmic antibody, biotin-conjugated myeloperoxidase-antineutrophil cytoplasmic and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of  $450\text{ nm} \pm 2\text{ nm}$ . The concentration of myeloperoxidase-antineutrophil cytoplasmic antibody in the samples is then determined by comparing the O.D. of the samples to the standard curve.

---

### Sample Collection:

- **Serum:** Use a serum separator tube (SST) and allow samples to clot for two hours at room temperature or overnight at  $4\text{ }^{\circ}\text{C}$  before centrifugation for 15 minutes at  $1000 \times g$ . Remove serum and assay immediately or aliquot and store samples at  $-20\text{ }^{\circ}\text{C}$  or  $-80\text{ }^{\circ}\text{C}$ . Avoid repeated freeze-thaw cycles.
- **Plasma:** Collect plasma using EDTA or heparin as an anticoagulant. Centrifuge for 15 minutes at  $1000 \times g$  at  $2-8\text{ }^{\circ}\text{C}$  within 30 minutes of collection. Assay immediately or aliquot and store samples at  $-20\text{ }^{\circ}\text{C}$  or  $-80\text{ }^{\circ}\text{C}$ . Avoid repeated freeze-thaw cycles.
- **Tissue Homogenates:** Rinse 100 mg tissue with  $1 \times \text{PBS}$ , homogenize in 1 mL of  $1 \times \text{PBS}$  and store overnight at  $-20\text{ }^{\circ}\text{C}$ . After two freeze-thaw cycles to break the cell membranes, centrifuge the homogenates for 5 minutes at  $5000 \times g$ ,  $2-8\text{ }^{\circ}\text{C}$ . Remove and assay the supernate immediately. Alternatively, aliquot and store samples at  $-20\text{ }^{\circ}\text{C}$  or  $-80\text{ }^{\circ}\text{C}$ . Centrifuge the sample again after thawing before the assay. Avoid repeated freeze-thaw cycles.

---

### Calculation of Results:

Average the duplicate readings for each standard and sample and subtract the average zero standard optical density.

Create a standard curve by reducing the data using computer software capable of generating a four parameter logistic (4-PL) curve fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the x-axis against the concentration on the y-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the target antigen concentration versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data.

If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.

---

### Assay Precision:

Intra-assay precision (precision within an assay): Three samples of known concentration were tested twenty times on one plate to assess precision.

Inter-assay precision (precision between assays): Three samples of known concentration were tested in twenty assays to assess precision.

- Intra-assay: CV% less than 8%

## Application Details

---

- Inter-assay: CV% less than 10%

---

Restrictions: For Research Use only

## Handling

---

Precaution of Use: The Stop Solution provided with this kit is an acid solution. Wear eye, hand, face and clothing protection when using this material.

Handling Advice:

- The kit should not be used beyond the expiration date on the kit label.
- Do not mix or substitute reagents with those from other lots or sources.
- If samples generate values higher than the highest standard, dilute the samples with Sample Diluent and repeat the assay.
- Any variation in Sample Diluent, operator, pipetting technique, washing technique, incubation time/temperature and kit age can cause variation in binding.
- This assay is designed to eliminate interference by soluble receptors, binding proteins and other factors present in biological samples. Until all factors have been tested in the Immunoassay, the possibility of interference cannot be excluded.

---

Storage: 4 °C/-20 °C

---

Storage Comment: For unopened kit: All the reagents should be kept according to the labels on vials.

---

Expiry Date: 6 months
