Target Details

Background:	Damage-regulated autophagy modulator (DRAM) is a p53 target gene encoding a lysosomal
	protein that induces autophagy, a process that degrades cytosolic proteins and organelles. It
	has been suggested that activation of DRAM by p53 is simultaneous to the activation by p53 of
	one or more proapoptotic genes such as PUMA, Bax, etc., and that the signaling pathways
	regulated by these genes promote a full cell death response. By itself, DRAM cannot induce
	apoptosis, but the fact that it is inactivated in certain cancers highlights the importance of
	DRAM and suggests that autophagy may play a more important role in cancer than initially
	suspected. At least two different isoforms of DRAM are known to exist.Synonyms: DNA
