generally the g phosphate of ATP, onto an acceptor amino acid in a substrate protein. By this
basic mechanism, protein kinases mediate most of the signal transduction in eukaryotic cells,
regulating cellular metabolism, transcription, cell cycle progression, cytoskeletal rearrangement
and cell movement, apoptosis, and differentiation. With more than 500 gene products, the
protein kinase family is one of the largest families of proteins in eukaryotes. The family has
been classified in 8 major groups based on sequence comparison of their tyrosine (PTK) or
serine/threonine (STK) kinase catalytic domains. The STE group (homologs of yeast Sterile 7,
11, 20 kinases) consists of 50 kinases related to the mitogen-activated protein kinase (MAPK)
cascade families (Ste7/MAP2K, Ste11/MAP3K, and Ste20/MAP4K). MAP kinase cascades,
consisting of a MAPK and one or more upstream regulatory kinases (MAPKKs) have been best
characterized in the yeast pheromone response pathway. Pheromones bind to Ste cell surface
receptors and activate yeast MAPK pathway.

Immunohistochemistry (Paraffin-embedded Sections)

Image 1. Formalin-fixed and paraffin-embedded human cancer tissue reacted with the primary antibody, which was peroxidase-conjugated to the secondary antibody, followed by DAB staining. This data demonstrates the use of this antibody for immunohistochemistry, clinical relevance has not been evaluated. BC = breast carcinoma, HC = hepatocarcinoma.
