

## Datasheet for ABIN458195 Pig anti-Human IgE (Fc Region) Antibody (HRP)

Overview	
Quantity:	1 mL
Target:	IgE
Binding Specificity:	Fc Region
Reactivity:	Human
Host:	Pig
Clonality:	Polyclonal
Conjugate:	HRP
Application:	ELISA, Western Blotting (WB), Immunocytochemistry (ICC), Dot Blot (DB),
	Immunohistochemistry (Paraffin-embedded Sections) (IHC (p))
Product Details	
Immunogen:	Purified monoclonal IgE isolated from human serum. Freund's complete adjuvant is used in the
	first step of the immunization procedure.
Specificity:	Horseradish peroxidase-conjugated IgG fraction of polyclonal Swine antiSerum to Human IgE, Fc specific.
Cross-Reactivity (Details):	Inter-species cross-reactivity is a normal feature of antibodies to immunoglobulins, since Ig of
	different species frequently share antigenic determinants. Cross-reactivity of this antiSerum
	has not been tested in detail.
Characteristics:	The reactivity of the antiserum is directed to the Fc subunit of the IgE molecule which
	expresses strict isotypic (class) specificity. It does not react with any non-Ig protein in human
	serum, as tested by immunoelectrophoresis and double radial immunodiffusion. In enzyme-

immunocytochemical and immunohistochemical staining for the detection of IgE at the cellular	
and subcellular level by staining of appropriately treated cell and tissue substrates, to	
demonstrate circulating IgE antibodies in serodiagnostic microbiology and autoimmune	
diseases, to identify a specific antigen using a reference antibody of human origin known to be	
of the IgE isotype in the middle layer of the indirect test procedure, in non-isotopic assay methodology (e.g. ELISA) to measure IgE in human serum or other body fluids. This immunoconjugate is not pre-diluted. The optimum working dilution of each conjugate should be established by titration before being used. Excess labelled antibody must be avoided because it may cause high unspecific background staining and interfere with the specific signal.

All rights reserved. Storage Comment:

The lyophilized conjugate is shipped at ambient temperature and may be stored at +4°C, prolonged storage at or below -20°C. Prior to use, an aliquot is thawed slowly at ambient temperature, spun down again and used to prepare working dilutions by adding sterile phosphate buffered saline (PBS, pH 7.2). Repeated thawing and freezing should be avoided. Working dilutions should be stored at +4°C, not refrozen, and preferably used the same day. If a slight precipitation occurs upon storage, this should be removed by centrifugation. It will not affect the performance of the immunoconjugate.
