	UBCE7IP3, RanBP-type and C3HC4-type zinc finger-containing protein 1, HBV-associated factor
	4, Heme-oxidized IRP2 ubiquitin ligase 1, Hepatitis B virus X-associated protein 4, RING finger
	protein 54, Ubiquitin-conjugating enzyme 7-interacting protein 3, RBCK1
	Background: E3 ubiquitin-protein ligase, which accepts ubiquitin from specific E2 ubiquitin-
	conjugating enzymes, such as UBE2L3/UBCM4, and then transfers it to substrates. Functions
	as an E3 ligase for oxidized IREB2 and both heme and oxygen are necessary for IREB2
	ubiquitination. Promotes ubiquitination of TAB2 and IRF3 and their degradation by the
	proteasome. Component of the LUBAC complex which conjugates linear ('Met-1'-linked)
	polyubiquitin chains to substrates and plays a key role in NF-kappa-B activation and regulation
	of inflammation. LUBAC conjugates linear polyubiquitin to IKBKG and RIPK1 and is involved in
	activation of the canonical NF-kappa-B and the JNK signaling pathways. Linear ubiquitination
	mediated by the LUBAC complex interferes with TNF-induced cell death and thereby prevents
	inflammation. LUBAC is proposed to be recruited to the TNF-R1 signaling complex (TNF-RSC)
	following polyubiquitination of TNF-RSC components by BIRC2 and/or BIRC3 and to conjugate
	linear polyubiquitin to IKBKG and possibly other components contributing to the stability of the
	complex. Together with FAM105B/otulin, the LUBAC complex regulates the canonical Wnt
	signaling during angiogenesis. Binds polyubiquitin of different linkage types.
