	Background: The membrane-associated protein encoded by this gene is a member of the
	superfamily of ATP-binding cassette (ABC) transporters. ABC proteins transport various
	molecules across extra- and intra-cellular membranes. ABC genes are divided into seven
	distinct subfamilies (ABC1, MDR/TAP, MRP, ALD, OABP, GCN20, White). This protein is a
	member of the MDR/TAP subfamily. Members of the MDR/TAP subfamily are involved in
	multidrug resistance as well as antigen presentation. This half-transporter likely plays a role in
	mitochondrial function. Localized to 2q26, this gene is considered a candidate gene for lethal
	neonatal metabolic syndrome, a disorder of mitochondrial function.
