	Background: ATP-binding cassette (ABC) transporters are an evolutionarily conserved family of		
	widely-expressed proteins that use ATP hydrolysis to catalyze the transport of various		
	molecules across extracellular and intracellular membranes. As the largest family of		
	transmembrane proteins, ABC genes comprise several subfamilies. Eukaryotic ABC		
	transporters are largely responsible for trafficking hydrophobic compounds either within the		
	cell, as part of a metabolic process, or outside the cell, for transport to other organs or for		
	secretion from the body. ABCF2 in particular plays a putative role in tumor suppression at		
	metastatic sites and in the endocrine pathway for breast cancer and may be a prognostic		
	marker for clear cell ovarian adenocarcinoma.
