Target Details

Background:	Synonyms: Advanced Glycation End products, Serum albumin, BSA, ALB		
	Background: Advanced Glycation End products (AGEs) are the result of a chain of chemical		
	reactions after an initial glycation reaction. The intermediate products are known, variously, as		
	Amadori, Schiff base and Maillard products, named after the researchers who first described		
	them. (The literature is inconsistent in applying these terms. For example, Maillard reaction		
	products are sometimes considered intermediates and sometimes end products.) Side		
	products generated in intermediate steps may be oxidizing agents (such as hydrogen peroxide),		
	or not (such as beta amyloid proteins). "Glycosylation" is sometimes used for "glycation" in the		
	literature, usually as 'non-enzymatic glycosylation. The AGE-modified BSA was produced by		
	reacting BSA with glycolaldehyde under sterile conditions followed by extensive dialysis and		
	purification steps.
