Background:	Collapsin-response mediator proteins (CRMPs) are highly expressed in the developing brain
	where they play major roles in axonal outgrowth, neurite differentiation, and apoptosis. Their
	continued expression in areas of high synaptic remodeling such as the cerebellum,
	hippocampus, and the olfactory system suggests that these proteins may also be involved in
	adult brain plasticity. CRMP-1 was initially identified as a dihydro-pyrimidinase expressed
	exclusively in brain, later studies have shown that it is involved with neurotrophin (NT) 3-
	induced neurite formation and outgrowth. CRMP-1 localization switches from axonal to
	somatodendritic when neurons reach functional maturity, suggesting that it is involved in early
	neuronal differentiation as well as in later processes related to the survival or death of the new
	generated neurons. This antibody is expected to recognize only the longest isoform of CRMP-
