Background:	Adipose tissue of an organism plays a major role in regulating physiologic and pathologic
	processes such as metabolism and immunity by producing and secreting a variety of bioactive
	molecules termed adipokines (reviewed in 1). One highly conserved family of adipokines is
	adiponectin/ACRP30 and its structural and functional paralogs, the C1q/tumor necrosis factor
	related proteins (CTRPs) 1-7 (2). Unlike adiponectin, which is expressed exclusively by
	differentiated adipocytes, the CTRPs are expressed in a wide variety of tissues (3). These
	proteins are thought to act mainly on liver and muscle tissue to control glucose and lipid
	metabolism. An analysis of the crystal structure of adiponectin revealed a structural and
	evolutionary link between TNF and C1q-containing proteins, suggesting that these proteins
	arose from a common ancestral innate immunity gene (4). Multiple isoforms of mouse CTRP4
	have been reported.Synonyms: CTRP4, Complement C1q tumor necrosis factor-related protein

Gene ID:	114900
UniProt:	Q9BXJ3
Application Details	
Application Notes:	ELISA. Western Blot: CTRP4 antibody can be used for the detection of CTRP4 at 1 - 2 µg/mL.
	Ratbrain cell lysate can be used as positive control. These proteins are often highly
	modifiedpost-translationally and migrate in SDS-PAGE at positions other than their predicted
	size. Immunohistochemistry.
	Other applications not tested.
	Optimal dilutions are dependent on conditions and should be determined by the user.
