|                     | Background: APPBP2 is a hydrophilic, microtubule binding protein that functions in the                             |
|                     | trafficking of Beta-Amyloid precursor protein. It is expressed in a variety of cell types and                      |
|                     | localizes to the cytoplasm. APPBP2 shares homology with kinesin light chain. It consists of a                      |
|                     | coiled-coil domain, PKC phosphorylation sites, four imperfect C-terminal tandem repeats, eight                     |
|                     | tetratricopeptide repeats and N- and C-terminal globular structures. APPBP2 recognizes and                         |
|                     | binds to the basolateral sorting sequence (BaSS) present in the cytoplasmic domain of the                          |
|                     | Beta-Amyloid precursor protein. In addition, APPBP2 interacts with the androgen receptor and                       |
|                     | suppresses androgen signaling.   |
