AAA domain containing, member 3B, TOB3, ATD3A_HUMAN, ATAD3A/B/C.
Background: The AAA ATPase family of molecular chaperones are characterized by a highly
conserved AAA motif. Composed of 200-250 residues, the AAA domain contains Walker
homology sequences and imparts ATPase activity. Members of the AAA ATPase family act as
DNA helicases as well as transcription factors and are thought to be involved in several cellular
functions such as cell-cycle regulation, protein proteolysis, organelle biogenesis and vesicle-
mediated protein transport. Mitochondrial membrane proteins ATAD3A and ATAD3B contribute
to the stabilization of nucleoids which are large mitochondrial DNA (mtDNA)-protein
complexes. ATAD3A/B may participate in the transformation pathway and the chemosensitivity
of oligodendrogliomas. The genes encoding ATAD3A/B/C maps to human chromosome 1,
which houses over 3,000 genes and is the largest human chromosome spanning about 260
million base pairs and making up 8 % of the human genome.
