Target Details	
	Background: This gene encodes a member of the immunoglobulin superfamily. The gene is
	located in a cluster of butyrophilin-like genes in the juxta-telomeric region of the major
	histocompatibility complex on chromosome 6. A pseudogene of this gene has been identified in
	this cluster. The encoded protein is an integral plasma membrane protein involved in lipid, fatty-
	acid, and sterol metabolism. Alterations in this gene may be associated with several disease
	states including metabolic syndrome. Multiple alternatively spliced transcript variants encoding
	different isoforms have been found for this gene. [provided by RefSeq, Jul 2013]
