chicken and zebrafish, and maps to human chromosome 11q14.1. With approximately 135
million base pairs and 1,400 genes, chromosome 11 makes up around 4 % of human genomic
DNA and is considered a gene and disease association dense chromosome. The chromosome
11 encoded Atm gene is important for regulation of cell cycle arrest and apoptosis following
double strand DNA breaks. Atm mutation leads to the disorder known as ataxia-telangiectasia.
The blood disorders Sickle cell anemia and thalassemia are caused by HBB gene mutations.
Wilms' tumors, WAGR syndrome and Denys-Drash syndrome are associated with mutations of
the WT1 gene. Jervell and Lange-Nielsen syndrome, Jacobsen syndrome, Niemann-Pick
disease, hereditary angioedema and Smith-Lemli-Opitz syndrome are also associated with
defects in chromosome 11. The PTD015 gene product has been provisionally designated
PTD015 pending further characterization.
