Background: C1orf77, also known as Friend of PRMT1 protein, is a 248 amino acid protein that
plays an essential role in the ligand-dependent activation of estrogen receptor target genes.
C1orf77 is tightly associated with chromatin and is modified by both asymmetric and
symmetric arginine methylation. Depletion of C1orf77 results in almost complete block of
estradiol-induced promter occupancy by the estrogen receptor. Also, complete knockdown of
C1orf77 mRNA in adult erythroid progenitors stongly induces fetal hemoglobin, suggesting that
C1orf77 is a critical modulator ofglobin gene expression. There are two isoforms of C1orf77
that are produced as a result of alternative splicing events. The gene encoding C1orf77 maps to
human chromosome 1, the largest human chromosome spanning about 260 million base pairs
and making up 8 % of the human genome. There are about 3,000 genes on chromosome 1, and
considering the great number of genes there are also a large number of diseases associated
with chromosome 1.
