Background:	Synonyms: ABRA C-terminal-like protein, abracl, ABRAL_HUMAN, Chromosome 6 open reading	
	frame 115, Costars family protein ABRACL, HSPC280, Hypothetical protein LOC58527,	
	PRO2013, Uncharacterized protein C6orf115.	
	Background: C6orf115 is a Making up nearly 6 % of the human genome, chromosome 6	
	contains around 1,200 genes within 170 million base pairs of sequence. Deletion of a portion of	
	the q arm of chromosome 6 is associated with early onset intestinal cancer suggesting the	
	presence of a cancer susceptibility locus. Porphyria cutanea tarda is associated with	
	chromosome 6 through the HFE gene which, when mutated, predisposes an individual to	
	developing this porphyria. Notably, the PARK2 gene, which is associated with Parkinson's	
	disease, and the genes encoding the major histocompatiblity complex proteins, which are key	
	molecular components of the immune system and determine predisposition to rheumatic	
	diseases, are also located on chromosome 6. Stickler syndrome, 21-hydroxylase deficiency and	
	maple syrup urine disease are also associated with genes on chromosome 6. A bipolar disorde	
	susceptibility locus has been identified on the q arm of chromosome 6. The C6orf115 gene	
	product has been provisionally designated C6orf115 pending further characterization.	
Gene ID:	58527
