| Quantity:            | 100 μL  |
|----------------------|---|
| Target:              | FAT3  |
| Binding Specificity: | AA 601-800  |
| Reactivity:          | Human   |
| Host:                | Rabbit  |
| Clonality:           | Polyclonal  |
| Conjugate:           | This FAT3 antibody is conjugated to Alexa Fluor 750   |
| Application:         | Immunofluorescence (Cultured Cells) (IF (cc)), Immunofluorescence (Paraffin-embedded Sections) (IF (p)) |

#### **Product Details**

| Immunogen:            | KLH conjugated synthetic peptide derived from human CDHF15/FAT3 |
|-----------------------|---|
| Isotype:              | IgG   |
| Predicted Reactivity: | Human,Mouse,Rat,Dog,Cow,Sheep,Rabbit                            |
| Purification:         | Purified by Protein A.  |

### **Target Details**

| Target:           | FAT3   |  |
|-------------------|--|--|
| Alternative Name: | CDHF15/FAT3 (FAT3 Products)  |  |
| Background:       | Synonyms: Cadherin family member 15, CDHF15, CDHR10, FAT tumor suppressor homolog 3, |  |

Fat3, FAT3\_HUMAN, hFat3, Protocadherin Fat 3.

IF(IHC-P) 1:50-200

Background: The cadherins represent a family of Ca2+-dependent adhesion molecules that function to mediate cell to cell binding that is critical for the maintenance of structure and morphogenesis. Cadherins each contain a large extracellular domain at the N-terminus, which is characterized by a series of five homologous repeats, the most distal of which is thought to be responsible for binding specificity. The relatively short C-terminal intracellular domain interacts with a variety of cytoplasmic proteins, including -catenin, to regulate cadherin function. The cadherin superfamily includes cadherins, protocadherins, desmogleins and desmocollins. FAT3 (FAT tumor suppressor homolog 3, also known as CDHF15 or CDHR10, is a 4,589 amino acid single-pass type I membrane protein expressed in ES cells, primitive neuroectoderm, fetal brain, infant brain, adult neural tissues and prostate. Containing thirty-three cadherin domains, four EGF-like domains and one laminin G-like domain, FAT3 may participate in the interactions between neurites derived from specific subsets of neurons during development.
