	Background: Required for translocation of GLUT4 to the plasma membrane in response to	
	insulin signaling (By similarity). Required to coordinate membrane tubulation with	
	reorganization of the actin cytoskeleton during endocytosis. Binds to lipids such as	
	phosphatidylinositol 4,5-bisphosphate and phosphatidylserine and promotes membrane	
	invagination and the formation of tubules. Also promotes CDC42-induced actin polymerization	
	by recruiting WASL/N-WASP which in turn activates the Arp2/3 complex. Actin polymerization	
	may promote the fission of membrane tubules to form endocytic vesicles. Required for the	
	formation of podosomes, actin-rich adhesion structures specific to monocyte-derived cells.	
	May be required for the lysosomal retention of FASLG/FASL.
