| | Background: Required for translocation of GLUT4 to the plasma membrane in response to | |
| | insulin signaling (By similarity). Required to coordinate membrane tubulation with | |
| | reorganization of the actin cytoskeleton during endocytosis. Binds to lipids such as | |
| | phosphatidylinositol 4,5-bisphosphate and phosphatidylserine and promotes membrane | |
| | invagination and the formation of tubules. Also promotes CDC42-induced actin polymerization | |
| | by recruiting WASL/N-WASP which in turn activates the Arp2/3 complex. Actin polymerization | |
| | may promote the fission of membrane tubules to form endocytic vesicles. Required for the | |
| | formation of podosomes, actin-rich adhesion structures specific to monocyte-derived cells. | |
| | May be required for the lysosomal retention of FASLG/FASL. | |
