Target Details	
Background:	Synonyms: Ceroid-lipofuscinosis, neuronal 8 epilepsy, progressive with mental retardation, Cln8, CLN8_HUMAN, EPMR, Protein CLN8, C8orf61 Background: CLN8, a 286 amino acid transmembrane protein, localizes mainly to the endoplasmic reticulum, but also partially to the ER-Golgi intermediate compartment (ERGIC). Mutations in the CLN8 gene cause neuronal ceroid lipofuscinosis 8 and progressive epilepsy with mental retardation (EPMR). Both disorders are forms of neuronal ceroid-lipofuscinose (NCL), a group of progressive neurodegenerative diseases found in children, characterized by failure of psychomotor development, impaired vision, seizures and premature death. The CLN8
	protein is one of eight proteins in the CLN family, including CLN1-CLN7, which are associated with NCL.
