Cytochrome c oxidase polypeptide, mitochondrial, Cytochrome c oxidase subunit 5A,		
Cytochrome c oxidase subunit 5A, mitochondrial, mitochondrial, Mitochondrial cytochrome c		
oxidase subunit Va, VA.		
Background: Cytochrome c oxidase (COX) is the terminal enzyme of the mitochondrial		
respiratory chain. It is a multi-subunit enzyme complex that couples the transfer of electrons		
from cytochrome c to molecular oxygen and contributes to a proton electrochemical gradient		
across the inner mitochondrial membrane. The complex consists of 13 mitochondrial- and		
nuclear-encoded subunits. The mitochondrially-encoded subunits perform the electron transfer		
of proton pumping activities. The functions of the nuclear-encoded subunits are unknown but		
they may play a role in the regulation and assembly of the complex. This gene encodes the		
nuclear-encoded subunit Va of the human mitochondrial respiratory chain enzyme. A		
pseudogene COX5AP1 has been found in chromosome 14q22. [provided by RefSeq, Jul 2008].
