	while some also inhibit legumain family enzymes. The CRES (cystatin-related epididymal	
	spermatogenic) protein defines a new subgroup in the family 2 cystatins of the cystatin	
	superfamily. CRES proteins lack two of the three consensus sites necessary for the cystatin	
	inhibition of C1 cysteine proteases. Due to their expression patterns, it is likely that CRES	
	proteins may perform unique and tissue-specific functions in the reproductive and	
	neuroendocrine systems. As a member of the CRES subfamily, Cystatin 9, also designated	
	CLM, is a 159 amino acid protein that is expressed in heart, placenta, lung, liver, skeletal muscle	
	and pancreas. Cystatin 9 is thought to play a role in hematopoietic differentiation or	
	inflammation. It has also been shown to be upregulated by LPS in some cancer cell lines, such	
	as promyelocytic leukemia (HL-60) and myelomonocytic leukemia.
