Background:	Synonyms: CP20A_HUMAN, CYP M, Cyp20a1, Cytochrome P450 20A1, Cytochrome P450	
	monooxygenase, Cytochrome P450, family 20, subfamily A, polypeptide 1, MGC22229.	
	Background: Cytochrome P450 proteins are heme-thiolate monooxygenases that mediate	
	NADPH-dependent electron transport and function to oxidize a variety of structurally unrelated	
	compounds, including steroids, fatty acids and xenobiotics. Specifically, Cytochrome P450s are	
	responsible for metabolizing arachidonic acid to hydroxyeicosatetraenoic acid (a regulator of	
	blood pressure) and epoxyeicosatrienoic acid (a molecule involved in signaling events).	
	CYP20A1 (cytochrome P450, family 20, subfamily A, polypeptide 1), also known as CYP-M, is a	
	462 amino acid single-pass membrane protein that belongs to the cytochrome P450 family.	
	CYP20A1 is thought to carry its own oxygen as it lacks a conserved I-helix motif and one amino	
	acid of its conserved heme binding site.
