| Background: eIF3K (Eukaryotic translation initiation factor 3 subunit K, Muscle-specific gene M9 |
| protein) is a widely expressed translation initiation factor that belongs to the eIF3 subunit K $$ |
| family. Translation initiation factor 3 (eIF3) is a multisubunit complex containing at least 12 |
| subunits. eIF3 binds to the 40S ribosomal subunit, promotes the binding of methionyl-tRNAi |
| and mRNA, and interacts with several other initiation factors to form the 40S initiation complex. |
| elF3K is the smallest subunit of elF3 and it interacts with several other subunits of elF3 and the |
| 40S ribosomal subunit. eIF3K is conserved among high eukaryotes, including mammals, |
| insects, and plants, and it is ubiquitously expressed in human tissues. eIF3K is distributed both |
| in nucleus and cytoplasm and colocalizes with cyclin D3, a regulatory subunit of cyclin- |
| dependent kinase 4 (Cdk4). |
