	growth factor inducible anti prolerative, NGF inducible anti prolerative protein PC3, NGF-
	inducible anti-prolerative protein PC3, PC3, Pheochromacytoma cell 3, Protein BTG2, TIS21.
	Background: Eukaryotic RNA polymerase II mediates the synthesis of mature and functional
	messenger RNA. This is a multistep process, called the transcription cycle, that includes five
	stages: preinitiation, promoter, clearance, elongation and termination. Elongation is thought to
	be a critical stage for the regulation of gene expression. ELL (11-19 lysine-rich leukemia
	protein), also designated MEN, functions as an RNA polymerase II elongation factor that
	increases the rate of transcription by suppressing transient pausing by RNA polymerase II. It is
	also thought to regulate cellular proliferation. ELL is abundantly expressed in peripheral blood
	leukocytes, skeletal muscle, placenta and testis, with lower expression in spleen, thymus, heart,
	brain, lung, kidney, liver and ovary. ELL3 is a 397 amino acid nuclear protein that functions as an
	RNA polymerase II elongation factor that increases the rate of transcription by suppressing
	transient pausing by RNA polymerase II. Though similar to ELL and ELL2, ELL3 is exclusively
	expressed in testis.
