| Background: EXTL3 is a member of the EXT (hereditary multiple exostosin) gene family of |
| tumor suppressors encoding glycosyltransferases involved in heparan sulfate (HS) |
| biosynthesis. Within this family, the C-terminus is conserved between all members from C. |
| elegans to vertebrates. EXTL3 is a ubiquitously expressed, developmentally regulated, single- |
| pass type II membrane protein that localizes to the endoplasmic reticulum membrane. EXTL3 |
| adds N-acetylglucosamine (GlcNAc) to the polysaccharide-protein linkage region and to the |
| growing HS chain suggesting that it plays a role in both the initiation and elongation of HS |
| chains. In addition, EXTL3 may act as a Reg receptor, binding Reg via its N-terminus. |
