	disorders. The GAN gene is located on chromosome 16 and, with mutation, may lead to giant
	axonal neuropathy, a nervous system disorder characterized by increasing malfunction with
	growth. The rare disorder Rubinstein-Taybi syndrome is also associated with chromosome 16,
	though through the CREBBP gene which encodes a critical CREB binding protein. Signs of
	Rubinstein-Taybi include mental retardation and predisposition to tumor growth and white
	blood cell neoplasias. Crohn's disease is a gastrointestinal inflammatory condition associated
	with chromosome 16 through the NOD2 gene. An association with systemic lupus
	erythematosis and a number of other autoimmune disorders with the pericentromeric region of
	chromosome 16 has led to the identification of SLC5A11 as a potential autoimmune modifier.
	The FAM96B gene product has been provisionally designated FAM96B pending further
	characterization.
