Background:	Synonyms: Forkhead box protein D3, HNF3/FH transcription factor genesis, HFH2	
	Background: This gene belongs to the forkhead family of transcription factors which is	
	characterized by a distinct forkhead domain. Mutations in this gene cause autoimmune susceptibility 1. Binds to the consensus sequence 5'-A[AT]T[AG]TTTGTTT-3' and acts as a transcriptional repressor. Also acts as a transcriptional activator. Promotes development of neural crest cells from neural tube progenitors. Restricts neural progenitor cells to the neural	
		crest lineage while suppressing interneuron differentiation. Required for maintenance of
		pluripotent cells in the pre-implantation and peri-implantation stages of embryogenesis.
